Fulton designed and manufactured a complete steam system for a prominent mid-west university. The system included six 150 hp dual fuel Vertical Multiport high pressure steam boilers, redundant 31,000 lbs/hr de-aerators, blow down handling and water treatment systems. In addition, the boilers were designed with automatic blow down systems which incorporated heat recovery equipment and an integral

sampling system. Plant Wide Controller (PWC) software package will be used to control the boilers. This boiler package will be used to provide building heat, humidification and process heat for a state of the art new research facility. Fulton manufactured the entire system with single point connections and skidded all equipment for easy installation.

Units shown prior to painting.
