Deaeration by Fulton

Fulton supplied our customer in the health care industry with a combination condensate storage and Deaerator tank system. The tank system was sold to a laundry processing plant in the mid-west. The system included an internally baffled ASME tank with compartments for condensate storage and feed water deaeration. Condensate transfer pumps, feed water pumps, level controls and a complete tray type deaeration system were packaged together in a single tank system. This design was an alternative specification item to individually packaged components. The Fulton design saved space in the boiler room at a very competitive price.
